Microtasks vs Macrotasks in the Event Loop

- **Microtasks** (like Promise `.then()` callbacks)
  have higher priority than macrostaks

- **Macrotasks**
  (like setTimeout(), I/O operations, and DOM events)
  are processed only after the microtask queue is empty

```
setTimeout(function(){
    console.info('1. 5s timeout');
}, 5000);

let a = Array.from({length: 10000000}, () => Math.random());
console.info('2. array created');

const p = new Promise(function(resolve, reject){
    a.sort();
    console.info('3. array sorted');
    resolve();
});

p.then(function(){
    console.info('4. promise resolved');
})

console.info('5. done');
```

➡ Prints 2, 3, 5, 4, 1
