Automatic Scaling with container Orchestration

DNS Load Balancing

```
www.example.com
    → 203.0.113.10   (Server A)
    → 203.0.113.20   (Server B)
    → 203.0.113.30   (Server C)
```

✓ DNS load balancing distributes clients across multiple servers by returning different IP addresses for the same domain name
